ABSTRACT

In 1987 and 1988, the New Brunswick (Canada) Department of Advanced Education and Training conducted follow-up surveys of graduates of full-time training programs to determine their labor market success. In 1987, of the 2,319 graduates surveyed, 1,574 (68%) responded, while in 1988, 1,578 (69%) of the 2,302 graduates surveyed responded. In both 1987 and 1988, 80% of the respondents were single, slightly less than half were female, approximately two-thirds had completed 12th grade as their highest level of education prior to entering the training program. The percentage of respondents finding employment improved gradually from 59% in 1983 to 74% in 1987 and 78% in 1988. In both 1987 and 1988, Health/Community Services respondents had the highest employment rate. Between the two years, there were significant declines in the employment rate of Heating, Ventilation, and Air Conditioning, Protective Services, and Wood and Related Materials respondents, with Wood and Related Materials having the lowest employment rate (48%) and the lowest percentage of respondents having work related to their training (40%). The percentage of employed respondents working in a field related to their training increased from 54% in 1985 to 60% in 1987 and 62% in 1988. Close to 90% of the respondents in both years were working in New Brunswick. In 1988, the average reported full-time earnings were $340 per week, an increase of $40 per week over 1987; the average wages for females rose from 70% of this total to 76%. Appendixes contain fact sheets for each training program studied, including data on the survey population, labor force participation, employment, unemployment, and the most common occupations of respondents and the industries most often employing them. Programs by Cluster Surveyed in 1988 53

I - INTRODUCTION

Every March the New Brunswick Department of Advanced Education & Training conducts a follow-up survey of graduates from its full-time regular training programs (at least 20 weeks in duration). Graduates from the previous academic year are asked a series of questions concerning their labour market experiences since graduation. These graduates will have been out of school for at least nine months. This information is analyzed to determine their labour market success after training.

Questionnaires are mailed out from the college the graduate attended. Completed questionnaires are returned to the college. Non-respondents are followed up with a second mail-out or a telephone call from the recruiting officer at the college. (A copy of the 1988 survey questionnaire is found in Appendix 1).

The Present Report

This report covers two survey years: 1987 (graduates from 1985-86) and 1988 (graduates from 1986-87).

In one significant way, this report will differ from its predecessors. The reorganization of the New Brunswick Community Colleges completed in 1985 resulted in each college having designated areas of specialization. There are 18 identified areas of specialization referred to as clusters. This report, then, will focus on cluster distinctions rather than the category breakdowns of previous analyses. Appendix 2 gives a list of programs by cluster surveyed in 1987 and 1988.

Throughout this report the term "respondent" will be used. The surveys were answered randomly and no scientific sampling techniques were used, so the term "respondent" cannot be considered interchangeable with the term "graduate".

Highlights are given for each analysis. Summary tables are located at the end of the report.

Response

1987

In 1987, of the 2319 graduates surveyed, 1574 answered for a response rate of 68%. This is in keeping with the response rate of previous surveys. Survey administrators aim for a response rate of 70%. Women (72%) responded more than men (65%).

There were variations in response rate by cluster. Some clusters, such as **Drafting & Design** (79%), have high response rate while other clusters, such as **Heating, Ventilation & Air Conditioning**, have below average response rates (52%).

The **Secretarial/Clerical** cluster had the largest percentage of the respondents (20%) followed by the **Business** (10%) and **Metals** (9%) clusters. Incidentally, these proportions are consistent with the cluster breakdown of the survey population.

1988

In the 1988 survey, 2302 graduates were surveyed. Of these, 1578 graduates responded for a response rate of 69%. Again, women were more likely to answer (71%) than men (67%).

Looking at the clusters, the highest response rates were in the **Drafting & Design** (84%) and **Protective Services** (81%). **Wood & Related Materials** (58%), **Mechanical - Motorized Equipment** (63%) and **Hospitality/Tourism** (63%) had the lowest response rates. A higher percentage of people are answering in each cluster which helps for interpretation.

Twenty-five percent of the respondents had taken programs in the **Secretarial/Clerical** cluster. This, again, reflected the proportion in the overall survey population.

II - GLOBAL ANALYSIS

Profile of Survey Respondents

It should be pointed out that the age, marital status and presence of dependents information are current to time of enrolment. These demographic characteristics will have changed considerably from the time of enrolment to the completion of the questionnaire. Therefore, the profile will give a picture of what the graduates looked like at the time of their initial enrolment.

1987

The majority of 1987 survey respondents (80%) were single at time of enrolment. Forty-five percent (45%) of respondents were female. Twelve hundred and twenty (1220) had no dependents.

The 15 - 19 years of age group had the highest number of respondents (656) followed by the 20 - 24 year olds (551).

Seventy-five percent (or 53) of the respondents with a martial status of "other" had dependents. A lower proportion, 64% (or 156) of married respondents had dependents.

Grade 12 was the highest level of education prior to training for 1014 (64%) of the 1574 respondents. Of the others, 167 reported academic upgrading as their highest level of education.

1988

The majority of respondents were single (80%) at time of enrolment. Most respondents did not have dependents(1239). As in 1987, slightly less than half were female (46%). The most noticeable difference between the two survey years was seen in the ages. Unlike the 1987 survey, the largest age group for this year was the 20 - 24 year olds (652). Next was the 15 -19 age group (543).

Respondents identifying "other" as their marital status when they enrolled were again the mostly likely to have dependents (74% or 46). Seventy-one percent (or 173) of respondents who were married at time of enrolment had dependents. This is an increase over the 1987 proportion.

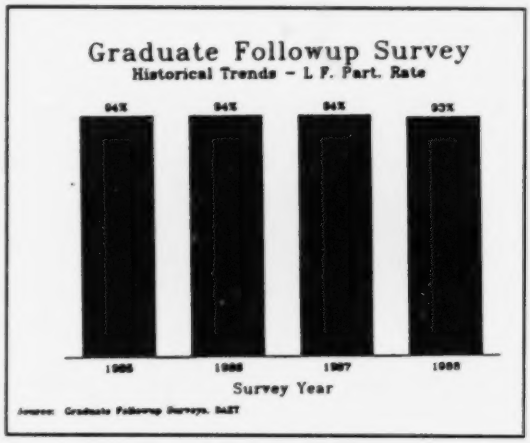
The highest level of education prior to training for 63% of respondents was Grade 12 (993 of 1578 respondents). Fewer of the graduates answering this year reported academic upgrading as their highest level of schooling prior to enrolment (99).

Summary - Labour Force Experiences of Respondents

Survey respondents are categorized according to their reported labour force activity. Depending upon their answers, respondents will be identified as either employed, unemployed or not in the labour force. The "not in the labour force" category is defined as respondents who are studying full-time, or not working because of own illness/disability or personal/family responsibilities. All other respondents not currently working are viewed as being unemployed.

Labour Force Participation Rate

The labour force participation rate is the sum total of the employed and the unemployed respondents divided by the total number of respondents, expressed as a percentage.



1987

The 94% labour force participation rate of NBCC graduates responding to the 1987 survey is very high compared to New Brunswick's 58% labour force participation rate for the same year. The **Applied Arts & Communication, Heating, Ventilation, & Air Conditioning, Heavy Equipment Operation** and **Protective Services** clusters all had 100% labour force participation by their respondents. **Electronics** had the lowest participation rate at 89% slightly less than the **Secretarial/Clerical** cluster at 90%.

1988

NBCC graduates responding to the 1988 survey reported a 93% labour force participation rate. Again this compares favourably with New Brunswick's labour force participation rate of 59% for the same year. The **Business, Construction, Mechanical-Motorized Equipment** and **Wood & Related Materials** clusters have very high labour force participation rates ranging from 98% - 100%. **Drafting & Design** had the lowest labour force participation rate (81%).

Employment Rate

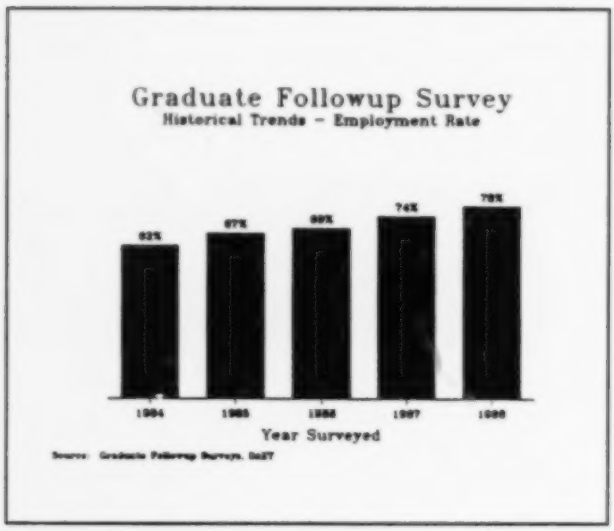
1987

The percentage of respondents finding employment has been gradually improving every year from 59% in the 1983 survey to 74% in the 1987 survey. **Health/Community Services** tops the list with 88% of its respondents employed. **Natural Resources** and **Construction** had the lowest employment rates at 58% and 60% respectively.

1988

Seventy-eight percent (78%) of graduates responding in 1988 were employed. **Health/Community Services** again has the highest employment rate (94%). Both **Business** and **Electronics** had significant employment improvements with 93% of respondents in each of these clusters finding work. **Drafting & Design, Metals** and **Natural Resources** also experienced improved employment results.

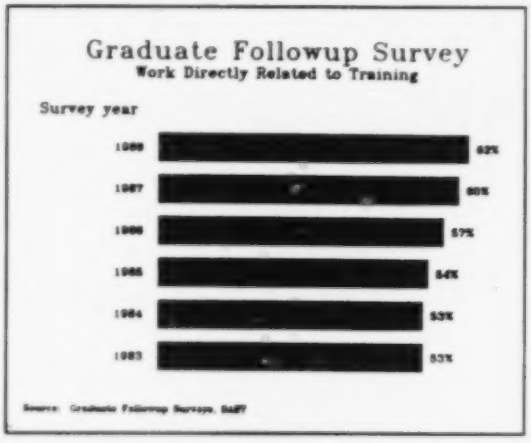
There were significant declines in employment since the last survey in the **Heating, Ventilation & Air Conditioning, Protective Services** and **Wood & Related Materials** clusters. The lowest employment rate (48%) and the lowest percentage of respondents having work related to their training (40%) was in the **Wood & Related Materials** cluster.



Employment Directly Related To Training

One objective of the survey is to determine if employed graduates are using their training in their current occupation. They are asked if their job is either directly, indirectly or not at all related to their training received at the community college.

The following discussion focuses on employment directly related to training.



1987

In the 1987 survey, 60% of the employed graduates responding to the survey had jobs directly related to their training. This had been steadily increasing from 54% in the 1985 survey. Twenty-one percent of employed respondents in the 1987 survey were in jobs not at all related to their training. Seventy-two percent of these respondents looked but could not find a training related job.

Personal Services (89%) and **Health/Community Services** had the largest proportion of respondents with work directly related to their training. Respondents from **Hospitality/Tourism** (74%) and **Metals** (72%) also reported greater than average success in this regard.

Employed respondents in the **Heating,Ventilation & Air Conditioning** and **Heavy Equipment Op.ration** clusters had the greatest difficulty in finding work related to their training at 32% and 33% respectively.

1988

Overall, 62% of employed survey respondents had employment directly related to their training. This has improved gradually over the years. Seventeen percent (17%) of employed respondents were in jobs not at all related to their training. Fifty-six percent of these respondents looked but could not find a training related job.

The contrast is greatly reduced this year between successful and less successful clusters with respect to work directly related to training. This is encouraging and perhaps indicates a closer link between training provided and the realities of the labour market. Thus, the situation improved in the **Electronics, Heating,Ventilation & Air Conditioning, Metals** and **Secretarial/Clerical** clusters. On the other hand, **Protective Services** suffered a strong decline.

This year the lowest proportion of respondents from any cluster finding work directly related to their training was 40% in the **Wood & Related Materials.**

16

1987

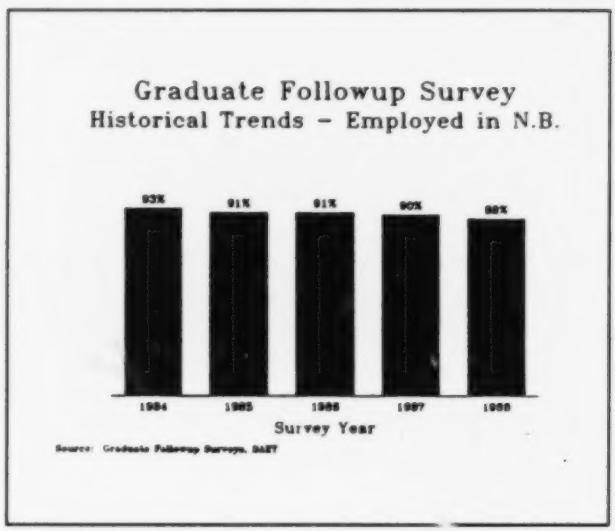
In the 1987 survey, 90% (986) of the employed respondents were working in New Brunswick. Ninety-nine percent (99%) of employed respondents in the **Personal Services** cluster had jobs in N.B.

Out-of-province employment is significant (more than 20%) in the following clusters: **Applied Arts & Communication, Hospitality/Tourism, Construction** and **Wood & Related Materials.**

1987

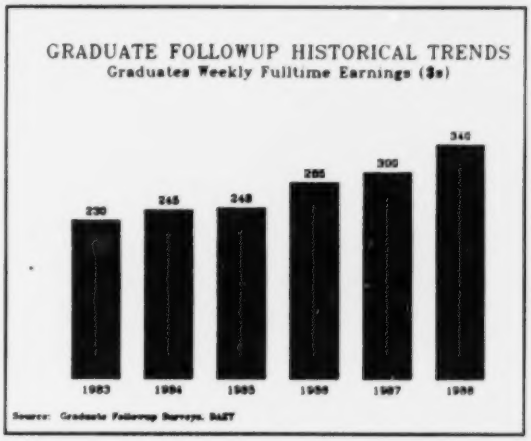
Eighty-eight percent (88%) of the employed respondents in the 1988 survey were working in New Brunswick. This has been declining gradually from the peak of 93% in the 1984 survey. More than 20% of the respondents in the following clusters are employed outside the Province: **Applied Arts & Communication, Electronics, Heating, Ventilation & Air Conditioning** and **Hospitality/Tourism.**

Finding employment in N.B. improved since the previous year for respondents in the **Construction,** and **Wood & Related Materials** clusters. Percentage declines were reported in the **Electronics, Heating, Ventilation & Air Conditioning, Mechanical-Industrial** and **Natural Resources** clusters.



Average Full-Time Earnings

Respondents do not necessarily work in the cluster of their training. Therefore, wages reported by cluster do not necessarily mean wages earned in that cluster. Also wage information should be interpreted with caution as some wage calculations are based on a small number of responses.



1987

In the 1987 survey the average reported full-time earnings were **$300** per week.

Respondents from the **Protective Services** and **Metals** clusters reported the highest average full-time weekly wages. The lowest weekly earnings were reported by respondents from the **Personal Services** cluster.

Female respondents, on average, earned approximately **70%** of what male respondents reported for full-time wages.

The highest wages for women were reported by those from the **Health/Community Services** cluster. Men from the **Metals** and **Protective Services** clusters had the highest earnings.

1988

Average reported full-time earnings had increased to **$340** per week by the time of the 1988 survey.

Respondents from the **Metals** and **Mechanical-Industrial** clusters reported the highest average weekly earnings. The lowest weekly earnings were, again, reported by respondents in the **Personal Services** cluster.

Protective Services was the only cluster where respondents reported a decline in average weekly earnings. The decline was dramatic, from $460 to $269.

Respondents from the **Mechanical-Industrial** and **Natural Resources** clusters reported the largest dollar increase in their earnings.

Both women and men increased their earnings. Female respondents, providing wage information, earned approximately **76%** of what male respondents earned. This was a healthy increase over 1987. The largest wage increase for women was reported by respondents from the **Hospitality/Tourism** cluster. For men, the largest wage increase was for those from the **Mechanical-Industrial** cluster.

LABOUR FORCE EXPERIENCES BY SELECTED VARIABLES

AGE

In the Graduate Follow-up Survey, "age" refers to age of the respondent at the time of enrolment. The following analysis gives information on the subsequent labour market experiences of students according to their age when they enrolled in their program.

1987

Most of the respondents (42%) were 15 - 19 year olds at time of enrolment. Albeit high, their 92% labour force participation rate was the lowest of all age groups. However, they reported the highest employment rate (76.5%).

One-third of all respondents were in the 20 - 24 years old group. They had an above average participation rate but their success in finding work was below average.

One-tenth of all respondents were the 25 - 29 years old, at time of enrolment. They had both the highest participation rate (96.5%) and a high employment rate.

Finally, twelve percent of all respondents were 30 years of age or over. While their labour force participation rate was average, their employment rate was the lowest.

Labour Force Results by Age Group
1987 Survey

Age Group	% of all respondents	# of respondents	Labour Force Participation Rate	Employment Rate
15-19 yrs	42%	656	92%	76.5%
20-24 yrs	35%	551	95%	72.5%
25-29 yrs	11%	171	96.5%	75%
30+ yrs	12%	194	94%	70%
TOTAL*	100%	1574	94%	74%

* Includes unknown responses

1988

One-third of all respondents were 15 - 19 years old, declining from the 1987 survey. Again, they had the lowest labour force participation rate but the highest employment rate.

This year, the largest group of respondents (41%) by age, at time of enrolment, were the 20 - 24 year olds. They had the highest participation rate and the highest employment rate. This is a significant increase in the employment rate for this age group compared to the 1987 survey.

As in the 1987 survey, one-tenth of the respondents were 25 - 29 years old at time of enrolment. While their participation rate is high, it has declined from the 1987 survey. They have the lowest employment rate of any age group, down from the previous year.

Finally, there were more older students this year responding to the survey. Fourteen percent of the respondents were 30 years of age or over. Their employment rate increased by 5% points with a small decline in their participation rate.

Labour Force Results by Age Group
1988 Survey

Age Group	% of all respondents	# of respondents	Labour Force Participation Rate	Employment Rate
15-19 yrs	34%	543	91%	80%
20-24 yrs	41%	652	95%	80%
25-29 yrs	11%	168	94%	71%
30+ yrs	14%	214	92%	75%
TOTAL*	100%	1578	93%	78.5%

* Includes unknown responses

Gender
(Including Part-Time Employment)

1987

Women had a slightly lower labour force participation rate (92%) than men (95.5%). However, at 80% their employment rate was higher than men (70%).

Men from the **Health/Community Services** cluster had the highest employment rate (96%) of all male respondents by cluster.

Women from the **Protective Services** cluster had the highest employment rate (100%) of all women by cluster, bearing in mind the small number of female respondents in this cluster.

Because of fairly even representation by gender in the **Applied Arts & Communication, Business,** and **Hospitality/Tourism** clusters, a comparison of employment rates by gender may be made. Respondents from the **Hospitality/Tourism** cluster had the greatest percentage difference in employment rates between women (82%) and men (68%).

Part-time

Only **10%** of all employment was **part-time.** Women account for 80% of that part-time employment. **Secretarial/Clerical, Personal Services** and **Health/Community Services** are the principal clusters for part-time employment.

1988

Both women and men had a slight decline in their labour force participation rate from the previous year. Again this year, the women's participation rate was 3.5 percentage points below the men's.

The employment rate of women remained at 80%. There was some adjustment at the cluster level with the employment rate increasing in the **Business** and **Health / Community Services** clusters.

Men had a substantial increase in their employment rate from 70% to 77%, largely attributed to more employment opportunities for men in the **Electronics, Metals, Natural Resources** and **Drafting & Design** clusters. Some of those gains were nonetheless offset by employment declines in the **Heating, Ventilation & Air Conditioning** and **Wood & Related** clusters.

Part-time

Part-time employment declined to 7% of all employment from 10% in the 1987 survey. However, women increased their percentage share of part-time employment from 80% to 84%. Again part-time employment continued to pre-dominate in the **Secretarial / Clerical, Personal Services** and **Health/Community Services** clusters.

The 1984 National Graduate Follow-up Survey of 1982 graduates found that graduates working full-time were less likely than part-time workers to have jobs unrelated to their course of study.

1988

The results of the NBCC Graduate Follow-up Survey in both 1987 and 1988 support this finding. Of those respondents working part-time in 1987, only 43% were employed in jobs directly related to their training, compared to 62% for full-time workers. In the 1988 survey, the difference was greater. Only 39% of respondents working part-time were employed in positions directly related to their training, compared to 64% for respondents employed full-time.

Marital Status and Presence of Dependents

The following analysis provides information on the labour market experiences of respondents according to their marital status and presence of dependents at time of enrolment. Marital status is defined as either single (never married), married or other. "Other" respondents are mostly likely to be separated, divorced or widowed.

1987

Overall, those respondents who were single and those who were married, at time of enrolment, reported a labour force participation that was above the norm. The participation rate for "other" respondents was lower. Single respondents had the highest employment rate followed by respondents who were married at time of enrolment. "Other" respondents had a considerably lower employment rate.

The labour force participation rate did not differ between respondents with dependents and those without dependents. However, respondents without dependents had a slightly higher employment rate.

Single: Eighty percent of all respondents identify themselves as single at time of enrolment. Overall, this group had the highest participation rate and the highest employment rate. Further examination by presence of dependents showed respondents with dependents having the highest employment rate of all groups. They also had one of the lowest labour force participation rates.

1988

The overall results for employment rate by marital status remained unchanged over the 1987 survey results. However, while each group had a higher employment rate than the previous survey, the gap between the highest employment rate and the lowest had widened. Again, the labour force participation rate for respondents who were single or married at time of enrolment was greater than that of "other" respondents.

The employment rates for all respondents regardless of dependents increased since the previous survey. However, those without respondents again had the higher employment rate of the two. Also there was no difference in their labour force participation rates.

Single: Again this year, 80% of all respondents identified themselves as single (never married) at time of enrolment. The differences in labour force participation rate and employment rate between those with dependents and those without dependents were not as great as in the 1987 survey. This group had the highest employment rate (80%) by martial status. Single respondents with dependents had the highest employment rate (83%) of all groups.

1987

Married: This group had a participation rate of 96%. There was minimal difference between married respondents with dependents and those without dependents. The employment rate of married respondents with dependents was slightly higher (74%) than that of married respondents without dependents (72%).

Other: This group had the lowest participation rate (93%). A very high percentage of them had dependents (75%). The most striking observation was the difference in participation rate between those with dependents (91%) and those without dependents (100%). Examination of employment rates of the two groups also showed a significant difference. Those with dependents had an employment rate of 60% while those without dependents had an employment rate of 77%. Sixty percent was the lowest overall employment rate of any identifiable socio-demographic group of respondents.

1988

Married: Married respondents had the highest participation rate (94%). Unlike the 1987 survey, there was a noticeable difference in participation rate between married respondents with dependents (95%) and those without (89%). The employment rate of married respondents had increased 3 percentage points compared to the previous survey.

Other: This group had the lowest labour force participation rate (89%) and lowest employment rate (66%) by marital status. Again 74% of all "other" respondents had dependents. As in the 1987 survey, the lowest participation rate (85%) and the lowest employment rate (62%) of all groups belonged to "other" respondents with dependents. Those without dependents had the highest participation rate (100%).

Previous Employment

Respondents are asked about their work activity during the 12 months immediately preceding enrolment. This information has been examined to determine if respondents without previous work experience have more difficulty finding employment after training than those with a previous attachment to the labour force.

There is an indication of some support for this premise.

1987

Respondents with no previous work experience had the lowest participation rate (90%) and a low employment rate (72%). However, while respondents who had worked full-time before training had the highest participation rate (96%), they also had the lowest employment rate (71%). Instead it was those with part-time work experience who had the highest labour force participation rate (96%) and highest employment rate (80%).

Labour Force Results by Previous Employment*
1987 Survey

Previous Employment	# of Respondents	Labour Force Participation Rate	Employment Rate
Full-Time	599	96%	71%
Part-Time	364	96%	80%
No, never worked	456	90%	72%
No, not recently	92	94%	73%
TOTAL**	1574	94% (1478)	74%

*Respondents are asked about their work activity during the 12 months immediately preceding enrolment.
**Includes unknown responses.

1988

The results of the 1988 survey give more support to the premise that work experience improves one's chances of finding employment. Respondents who had never worked, again had the lowest participation rate (89%) and a low employment rate (73%). Respondents without recent experience had the lowest employment rate (71%) and a low participation rate (90%).

Furthermore, people who had worked part-time before training, again, had the highest participation rate (95%) and the highest employment rate (85%). Also the employment rate is a five percentage point improvement since 1987.

Finally, the employment rate of respondents who had worked full-time before training, increased 9 percentage points to 80%.

This year employment during the 12 months prior to training was a clear indication of labour market success following graduation.

Previous Employment (Continued)

1987

**Labour Force Results by Previous Employment*
1988 Survey**

Previous Employment	# of Respondents	Labour Force Participation Rate	Employment Rate
Full-Time	658	95%	80%
Part-Time	356	95%	85%
No, never worked	451	89%	73%
No, not recently	91	90%	71%
TOTAL**	1578	93% (1468)	78.5%

*Respondents are asked about their work activity during the 12 months immediately preceding enrolment.
**Includes unknown responses.

College

The original intent was to analyze the labour market experiences of graduates according to both college and language of instruction. The college analysis is possible. However, survey questionnaires were not coded according to language of instruction. But, a fair picture of labour force results by language of instruction can be obtained through the analyzing labour force results by college.

All surveyed courses at the Anglophone colleges are in English. While most instruction at Francophone colleges is in French, some colleges offer bilingual programs such as bilingual clerk typist and bilingual stenographer. There are also English programs offered at the Bathurst college: beauty culture, clerk typist and stenographer.

1987

The two college groupings, Anglophone and Francophone, had the same response rate of 68%. Two-thirds of all respondents come from the Anglophone colleges, reflecting the population distribution in New Brunswick.

Respondents from the Anglophone colleges had a higher labour force participation rate (96%) than respondents from the Francophone colleges (90%). Graduates from the Miramichi college reported the highest labour force participation rate (98%). On the other hand, those from the Edmundston college reported the lowest at 86%.

The employment rate was considerably higher for respondents from Anglophone colleges (77%) than those from Francophone colleges (69%). This could be indicative of higher unemployment rates, in general, in the northern parts of New Brunswick. Looking at specific colleges, respondents from Dieppe reported the highest employment rate (88%) followed by those from the Saint John college (81%). The lowest employment rate was reported from graduates of the Bathurst college (62%).

1988

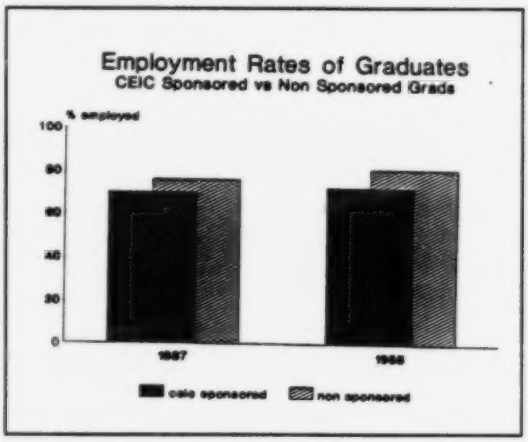
There was little overall change in the response rates of the Francophone and Anglophone colleges from the 1987 survey. However, there were some noticeable shifts.

The labour force participation rate was the same for the two college groupings at 93%. This is an increase for respondents from the Francophone colleges and a decline in the Anglophone sector. Respondents from the Bathurst college posted the most noticeable increase in labour force participation rate, those from St. Andrews the biggest decline.

The employment rate increased in both college sectors. However, the respondents from the Francophone colleges continued to have a lower employment rate (74%) than those from the Anglophone colleges (81%). Graduates from Bathurst and Moncton made the largest employment gains.

Sponsorship

People attending community college may be financially supported by different means. Many pay their own way. Some receive financial assistance in the form of a training allowance from CEIC. Others are sponsored by the industry for which they work. In this discussion respondents are placed in one of two categories: CEIC-sponsored or non-sponsored. Non-sponsored includes all other respondents except the CEIC-sponsored.



Traditionally, this variable has been of prime importance in the analysis of the graduate follow-up survey. Prior to the introduction of the Canadian Jobs Strategy (CJS) in 1984, a healthy proportion of full-time students were sponsored in their studies by the federal government through Canada Employment & Immigration Commission (CEIC). Since the onset of CJS, things have changed. Fewer students are CEIC-sponsored and the numbers are diminishing annually. The survey population of 1987 had 848 CEIC-sponsored graduates. The number declined to 738 in the 1988. Survey results by sponsorship will be discussed and some historical perspectives given.

1987

Thirty-five percent of respondents in the 1987 survey were CEIC-sponsored. Of these, 70% reported employment. This compares to 76% for non-sponsored respondents. As the table below illustrates, some clusters fared better in this regard than others.

1988

The CEIC-sponsored graduates responding to this survey, again, reported an overall employment rate of 72.5%, lower than non-sponsored respondents (81%). There were noticeable variations by cluster this year as well.

1987

Graduates of the **Health/Community Services, Mechanical-Industrial** and **Wood & Related Materials** clusters, who were sponsored and replied to the survey, reported much lower employment rates than their non-sponsored contemporaries. The reverse is true for respondents in the **Heating, Ventilation & Air Conditioning** and **Metals** clusters.

1988

In the **Construction** cluster, the gap favoured the non-sponsored graduates. they reported a 78% employment rate vs a 45% rate for the CEIC-sponsored respondents. On the other hand, in the **Natural Resources** cluster, employment results favoured the CEIC-sponsored respondents. They reported a 94% employment rate compared with the 69% rate of the non-sponsored.

Finally, the remarkable decline in employment rate reported by respondents from the **Wood & Related Materials** cluster was apparent for both non-sponsored (from 100% to 57%) and CEIC-sponsored respondents (from 70% to 43%).

Occupations

Employed respondents are asked their current occupation. These are then coded according to the Standard Occupational Classification 1980. In both survey years approximately 180 different occupational categories were reported. This analysis identifies the ten largest occupational categories reported by survey respondents. The results from both survey years are discussed here.

The most startling observation by occupational category was that **60%** of all employed **women** are working in **10** occupational categories. This was the case for both survey years. Seven of the occupational categories were common to both survey years. In general, wages increased between 1987 and 1988. One should bear in mind the small number of respondents giving wage information in certain occupational categories.

Earlier analyses have shown that men choose a wider range of programs. This is reflected in their wider range of occupational choices. For example, the **10** largest occupational categories for **men** accounted for approximately **40%** of all occupations reported by men. There was greater variance year to year as well. Only 4 of the occupational categories were common to each survey year. Wages increased in these common occupational categories one survey year to the next.

Ten Largest Occupational Categories of NBCC Graduates Responding to the 1987 Survey

( ) indicates the number of respondents providing wage information

Industries

Employed respondents are asked to report the industry they work for. This is then coded according to the Standard Industrial Classification 1980. Approximately 60 different industrial classifications were registered in both survey years. The following analysis includes both survey years.

Approximately **65%** of all employed **women** work in the 10 industries listed below. **All** of these industries are in the **service-producing** sector. There is some consistency over time as nine of the industries are common to the two survey years. Average weekly full-time wages have increased in most of these industries one year to the next.

Men are employed in a wider variety of industries. The top ten industrial categories listed account for **50%** of those employing male respondents. These include representation from the **goods-producing** industries (4 in the 1987 survey; 3 in the 1988 survey).

Men are more likely than women to be employed in the goods-producing industries. Goods-producing industries tend to pay higher wages than the service-producing industries.

Fifty percent of all employed respondents are located in 10 industrial categories.

Respondents Not Employed

Respondents who are currently not employed are categorized as either unemployed or not in the labour force. The "not in the labour force" category is defined as respondents who are studying full-time, or not working because of own illness/disability or personal/family responsibilities. All other respondents not currently working are viewed as being unemployed.

In the 1987 survey there were 96 respondents (6.0%) not in the labour force and 383 respondents (26%) unemployed.

In the 1988 survey, there was a slight increase in number of respondents not in the labour force (110 or 7%). On the other hand, there was an encouraging decline in the number of unemployed respondents to 316 (21.5%).

The graduate survey asks respondents the reason they are currently not employed. There are thirteen (13) possible responses. Refer to survey questionnaire in Appendix 1 for a complete listing. Approximately 50% of all respondents not in the labour force, in both survey years, gave the reason as full-time study. Also of note, in the 1988 survey, 14 of the 15 respondents giving personal/family responsibilities as a reason were female.

For respondents listed as being in the labour force but unemployed, the most common reason for currently not working, in both survey years, was because they could not find a job related to their training (24%).

Waiting recall for temporary / seasonal work and waiting recall from a temporary layoff was a frequent response from unemployed graduates from the **Construction, Mechanical-Motorized Equipment** and **Natural Resources** clusters for both survey years.

Most Common Reasons for Being Unemployed 1987 and 1988 Surveys

1987

Reason	%
Can't find a job related to training	24%
Cannot find any job	16%
Lack of experience	14%
Wait for recall temp/seasonal work	11%

1988

Reason	%
Can't find a job related to training	24%
Cannot find any job	16%
Waiting for a job to start	12%
Lack of experience	12%

Further Study

1987

Only 10% of all respondents to the 1987 survey were taking further training. Fifty-seven percent were studying full-time and the rest on a part-time basis. The most common reasons given for further training were to upgrade existing skills (28%) and to enhance employment opportunities (26%).

One quarter of those taking further training were in the **Secretarial/Clerical** cluster. The next most common clusters were **Business** (18%), **Electronics** (11%), and **Metals** (11%).

Further training was not common for respondents in the following clusters: **Applied Arts & Communication, Drafting & Design, Heating, Ventilation & Air Conditioning, Heavy Equipment Repair, Personal Services** and **Wood & Related Materials.**

Part-time training was favoured over full-time training in the **Health/Community Services** and **Business** clusters. The majority of respondents who had graduated from the **Electronics, Metals** and **Secretarial/Clerical** clusters were studying full-time.

Of the 18 respondents seeking a university degree, 5 of them were from the **Health/Community Services** cluster.

Programs of particular interest:

Business Technology - Accounting: 14 of the 24 respondents in the Business cluster taking further training graduated from this program.

1988

Eleven percent of all respondents were taking further training, 58% on a full-time basis. These figures are very similar to 1987.

As in the 1987 survey, the most popular reasons for taking further training were to upgrade existing skills (30%) (especially in the **Metals** and **Mechanical-Motorized Equipment** clusters) and to enhance employment opportunities (26%).

Fully 30% of all respondents taking further study are from the **Secretarial/Clerical** cluster. This is consistent with the previous survey. **Business** and **Metals** were again the next two most common clusters, although the number of respondents in the Business cluster taking further training decreased from the previous year. **Health/Community Services** also had a decline in those respondents availing themselves of further study.

Full-time training predominated in the **Electronics** and **Secretarial/Clerical** clusters. Part-time training was more common in the **Business** and **Mechanical-Motorized Equipment** clusters.

Programs of particular interest:

Stenographer: 30 of the 77 respondents in the Secretarial/Clerical cluster taking further training were graduates from this program. This represents 39% of the respondents graduating from this program. Two-thirds of those taking further study wanted to get a better, more interesting job or to enhance their employment opportunities.

Further Study (Continued)

1987

Stenographer: One-third of all respondents who graduated from this program (18 of 54) were taking further training.

Electronics Engineering Technology: Two options in this program, **Industrial & Communications** and **Communications** have approximately one-third of their respondents taking further training.

1988

Business Technology - Accounting: 63% of the respondents taking further training in the Business cluster were graduates from this program.

Refrigeration: Of the 13 respondents in this program 3 were taking further training, all to enhance their employment opportunities.

Future Plans

1987

Respondents are asked what they plan to be doing in 6 months' time. Staying at their present job is the most common answer. This represents 62% of employed respondents. The second most common response is to look for work related to training. Forty-five percent of respondents not in the labour force and forty percent of unemployed respondents chose this. It was also a common response for employed respondents (17%), most likely those in jobs not related to their training.

Ten percent of respondents expect to be working at a new, different or first job. This is particularly so for respondents in the **Applied Arts & Communication** cluster.

There are several clusters where forty percent or fewer plan to remain at their present job: **Construction, Heating, Ventilation & Air Conditioning, Heavy Equipment Operation,** and **Natural Resources.** These are also clusters where a high percentage of respondents are looking for work related to their training. This could reflect either the seasonal nature of their present occupation or a scarcity of work in their trade.

Looking for a job outside of New Brunswick is not a common response (3%). However, 8% of respondents in the **Mechanical-Industrial** cluster were considering this.

1988

Again graduates responding to the 1988 survey claimed "to remain at their present job" as the most common answer to the question on future plans. The majority of employed respondents (68%) gave this answer. This is an increase from the previous survey year. Looking for work related to training is the second most common response, mainly from unemployed respondents and those not in the labour force.

Business, Electronics and **Natural Resources** had a greater percentage of their respondents planning to remain at their present job, compared to the 1987 survey. **Protective Services** and **Wood & Related Materials** had the greatest percentage declines.

Only 1% of all respondents planned to look for any job outside New Brunswick, declining from 3% the year before.

Twenty-six percent of respondents in **Drafting & Design** were either continuing with a current training program or planning to start a new education/training program. This represents a large increase since 1987 (8%) and bears watching in future surveys.

THE NEW BRUNSWICK GRADUATE

FOLLOW-UP SURVEY

FACTSHEETS - 1988 AND 1987

Every March the New Brunswick Department of Advanced Education and Training conducts a survey of graduates from its regular training programs (at least 20 weeks in duration). The graduates of the previous academic year are asked a series of questions concerning their labour market experiences since graduation. They have been out of school at least nine months.

This report presents a factsheet for each program surveyed in the two survey years. The 1988 survey factsheets are followed by the 1987 survey factsheets. Results are also presented for each cluster, each college and a summary factsheet for all survey respondents. A more detailed analysis of the survey data for all respondents and at the cluster level is available in the report The New Brunswick Graduate Follow-up Survey Report for the 1987 and 1988 surveys.

INTERPRETATIVE NOTES

Notes: This section provides a written commentary for each factsheet, highlighting significant findings. Any reference to part-time employment and further training will be made in this section.

Survey Population: This box of information tells you the number of graduates surveyed, the number answering, and their gender. A response rate has also been calculated.

CNB #89042

Labour Force Results: This box of information provides information on the labour force results of respondents by gender. Survey respondents are categorized according to their reported labour force activity. Depending upon their answers, respondents will be identified as either employed, unemployed or not in the labour force. The "not in the labour force" category is defined as respondents who are studying full-time, or not working because of own illness/disability or personal/family responsibilities. All other respondents not currently working are viewed as being unemployed.

The labour force is the sum total of the employed and the unemployed. The employment rate is therefore determined by dividing the employed respondents by the total labour force, expressed as a percentage.

Employment: Location of employment, employment status, relation of work to training and average earnings are the indicators in this box of information.

Employed respondents are asked the status of their job. Are they working full-time, part-time or unsure ? The number and percentage working full-time are presented here. In the clusters and programs where part-time employment is significant, mention will be made of it in the NOTES section.

Respondents are also asked if their training is directly, indirectly or not at all related to their training. In the factsheets, work is considered to be related to training when the respondent indicated directly or indirectly. Only the number for full-time employment is presented. The percentage was calculated by dividing full-time work related to training by total employed, expressed as a percentage.

Earnings are the average for full-time employment for those respondents providing wage information. That number is found in brackets beside the dollar amount.

Unemployment: The unemployed respondents are asked the reason for their jobless state. There are thirteen possible responses. In this box the three most common reasons are given along with the number of unemployed respondents indicating that particular response.

Occupations: The three most common occupations for that factsheet are given.

Industries: The three most common industries for that factsheet are given.

BATHURST

NOTES

This college had an average response rate. Ninety percent of the respondents were in the labour force. Sixty-two percent were employed. More than ninety percent worked in New Brunswick. Seventy-one percent had full-time work related to their training. Of the unemployed, more than twenty percent could not find any job.

EDMUNDSTON

NOTES

The response rate for this college was below the overall survey average. Eighty-eight percent of the respondents were in the labour force. Three-quarters of those in the labour force were employed. Fifteen percent worked part-time. Almost half of those employed worked in one of two occupational categories. More than twenty percent of the respondents reported taking further training.

OVERALL SURVEY RESULTS

NOTES

The overall survey response rate is consistent with previous surveys. The employment rate is the highest since the survey's implementation. However, the percentage of respondents working in New Brunswick has been gradually declining since 1984. Average weekly full-time earnings have risen to $340. More than ninety percent of all reported employment was full-time. The most common reason for unemployment is "cannot find a job related to training". The information presented in this factsheet is discussed more fully in the report The New Brunswick Graduate Follow-up Survey Report for the 1987 and 1988 Surveys.

NURSING ORDERLY

NOTES

While participation in the Nursing Assistant program was predominately by females, this program had mostly male representation. The employment rate was high. All employed respondents worked for Health & Social Service Industries. Part-time employment was not a factor here, unlikely the Nursing Assistant program. Sixteen of the eighteen employed respondents were in jobs related to their training.

ACCOMMODATION, FOOD & BEVERAGE SERVICES

NOTES

Respondents from this program have a high employment rate with a high percentage having work related to their training. More than one-third of the employed respondents worked outside of New Brunswick. Seventy-five percent of the employed respondents had work in two industrial categories. Seasonal employment appears to be a factor in this program.

CLUSTER: MECHANICAL - MOTORIZED EQUIPMENT

NOTES

This cluster had a below average response rate. The employment rate was also below average. Those who were employed had difficulty in finding worked related to their training as seen by the low percentage of full-time workers with jobs related to their training. One-quarter of the unemployed respondents cited "could not find a job related to my training" as their reason for being unemployed.

MACHINIST

NOTES

Compared to overall survey results, the response rate and the employment rate for this program were both average. Seventy-three percent of the employed respondents were working in one occupational category: machinist & machine-tool setting-up occupations. More than twenty percent of te employed respondents worked outside of New Brunswick. The reasons given for unemployment indicate that seasonal employment may be a factor. Four of te thirty-two respondents were taking further training, three of them to upgrade existing skills.

CARPET LAYING

NOTES

This program had a small survey population and a low response rate. All five respondents were in the labour force. However, only one respondent was employed and the job was not related to his training.

SURVEY POPULATION

	Survey Pop.	Number of Respondents	Response Rate
Total	9	5	56%
Male	8	5	63%
Female	1	0	0%
